`in` keyword --> `Str`

If you want to see if a string contains some characters or if it contains a **substring** we can use the `in` keyword.

```
# Ask the costumer if they want fries
fries_reply = input("Do you want fries?")
# "yes!"
# "Yes!"

if "yes" in fries_reply.lower:
    print("Here are your fries.")
else:
    print("OK, you will not have fries.")
```
